technological systems become organized by commands from outside as when human intentions lead to the building of structures or machines but many nat ural systems become structured by their own internal processes these are the self organizing systems and the emergence of order within them is a complex phe nomenon that intrigues scientists from all disciplines unfortunately complexity is ill defined global explanatory constructs such as cybernetics or general sys tems theory which were intended to cope with complexity produced instead a grandiosity that has now mercifully run its course and died most of us have become wary of proposals for an integrated systems approach to complex matters yet we must come to grips with complexity some how now is a good time to reexamine complex systems to determine whether or not various scientific specialties can discover common principles or properties in them if they do then a fresh multidisciplinary attack on the difficulties would be a valid scientific task believing that complexity is a proper scientific issue and that self organizing systems are the foremost example r tomovic z damjanovic and i arranged a conference august 26 september 1 1979 in dubrovnik yugoslavia to address self organizing systems we invited 30 participants from seven countries included were biologists geologists physicists chemists mathematicians bio physicists and control engineers participants were asked not to bring manu scripts but rather to present positions on an assigned topic any writing would be done after the conference when the writers could benefit from their experi ences there
